Q1 Prime Number

10 marks

Q5
Print numbers from 1 to 10
10 marks

A mathematical analysis system needs to verify whether a given number is prime. A prime number is a number greater than 1 that has no divisors other than 1 and itself.

Write a Python program that:

- Accepts an integer input from the user
- Checks whether the number is prime using appropriate control flow constructs
- Displays a suitable message indicating whether the number is prime or not

Ensure proper use of loops and conditional statements.

Input

3

Output

```
enter the number
prime
```

Q2 Fibonacci series

10 marks

A numerical computation module is designed to generate a sequence where each number is the sum of the two preceding numbers. This sequence is known as the Fibonacci series.

Write a Python program that:

- Accepts a number n from the user
- Generates and displays the first n terms of the Fibonacci sequence
- Uses looping constructs to compute the sequence

Ensure the program handles cases where n is less than or equal to zero.

Your Code

```
1 n=int(input("enter the number:"))
2 a=0
3 b=1
4 if n<=0:
5     print("invalid input")
6 else:
7     for i in range(n):
8         print(a,end=" ")
9         c=a+b
10        a=b
11        b=c
```

Input

5

Output

enter the number:0 1 1 2 3

10 marks

A text processing system receives user input in the form of a string that may contain alphabets, digits, and special characters. Write a Python program that:

- Accepts a string input from the user
- Counts the number of vowels, consonants, digits, and special characters present in the string
- Displays the count for each category

Use appropriate string operations and control flow statements.

Input

Output

```
enter the string
vowels: 2
consonants: 3
digit 2
special 2
```

Q4 ODD or EVEN

10 marks

A program is designed to check whether a number entered by the user is even or odd. However, the program contains syntax and logical errors.

Analyze the given code and perform the following:

- Identify all errors present in the program
- Rewrite the corrected program
- Briefly justify each correction

```
num = input("Enter number: ")
if num % 2 == 0
    print("Even")
else
    print("Odd")
```

Your Code

```
1 num=int(input("enter number:"))
2 if num%2==0:
3     print("\neven")
4 else:
5     print("\nodd")
```

Input

3

Output

enter number:
odd

Print numbers from 1 to 10

10 marks

A program is intended to display numbers from 1 to 10 using a loop. However, some parts of the code are missing. Complete the program by filling in the blanks so that it correctly prints numbers from 1 to 10.

Program to print numbers from 1 to 10

for i in _____:

print(_____)

Also explain how the range() function works in this context.

Your Code

```
1 for i in range(1,11):
2     print(i,end=" ")
```

Input

stdin input

Output

1 2 3 4 5 6 7 8 9 10
